

HS 525: Cognitive, Sociocultural and Critical Foundations of the Learning Sciences

Lecture 6: August 23, 2025
Aditi Kothiyal

Reflection

One thing I learned last time...

1. How they're not mutually exclusive

One thing I found challenging last time...

1. Understanding real situations and which metaphor

<http://netlogoweb.org/launch#http://netlogoweb.org/assets/modelslib/Sample%20Models/Biology/Wolf%20Sheep%20Predation.nlogo>

Predators and Prey: (Pairs, 10 mins)

- 1) Set up the model so the sheep or the wolf grow unbounded.
- 2) What happens if either the sheep or the wolf grow unbounded?

Predators and Prey: (Pairs, 10 mins)

- 1) What did you learn?
- 2) How did you learn
(list the processes)?

What

How (List the processes ...)

How did you learn?

- Making sense of new material by paying attention to relevant information, organizing and connecting it to what you already know.
- Experience or trial & error and **reflecting** on experience.

What is constructivism?

- Knowledge does not have a one-to-one correspondence with reality; there is no objective knowledge *out there*.
- Knowledge is constructed by each individual; it “corresponds more and more closely to an external world”.
- Knowledge is tied to action and is not for describing the environment.
- The *quality* of knowledge is not assessed by how well it matches with reality, but by how successful it is for understanding the environment.
- *An individual is an interpreter of experience, and this interpretation helps them structure the world.*

Stages of Development

(https://ebrary.net/191355/sociology/piaget_s_theory_cognitive_development)

Developmental Stage/Age Range	Stage Characteristics	Major Milestones
Sensorimotor Birth to 2 years	Infants knowledge of the world is derived primarily from their senses & motor abilities.	Infants begin to think through mental actions & acquire the skill of object permanence. People/things still exist even when they are not in the infants sight.
Preoperational 2 to 6 years	Children's thinking is primarily egocentric; they tend to view the world from their own perspective.	Imaginative thought, vocabulary, & language explosion lead to young children's self-expression & increased sociability.
Concrete Operational 6 to 11 years	Children's thinking is limited to concrete experiences, what they can see, hear, touch, & directly experience. They begin the process of applying logical operations & principles to interpret the world.	Children are able to comprehend concepts of conservation, number classification, & scientific theory through the application of logical thought
Formal Operations 12 Years Through Adulthood	Adults & adolescents enter into the realm of analytical thinking; their reasoning ability is characterized by abstractions, hypothetical ideas/thoughts.	Adults & adolescents think broadly & theoretically about ethical/moral issues & politics.

[Object permanence](#)

[Stages of development](#)

Schemes

- All children are born with a basic mental structure over which all subsequent learning happens
- “a cohesive, repeatable **action sequence** possessing **component actions** that are tightly **interconnected** and governed by a **core meaning**.” (Piaget, 1952)
- Linked mental representations of the world, used for explaining perception/ experience -> equilibrium
- “Units of knowledge” - Building blocks of intelligent behaviour, a way of organizing knowledge.
- Set of “index cards” - objects, actions and abstract concepts
- Become more in number and complexity with development
- Can be combined logically to accomplish a task
- Strengthened or corroborated by the actions of others.

1

2

3

PERCEIVED SITUATION -> ACTIVITY -> BENEFICIAL or EXPECTED RESULT

Examples of schemes

- Grasping a bottle
- Making tea
- Converting word problems into numbers/equations
- (think of your own schemes)

Adaptation via Assimilation, Accommodation and Equilibration

Assimilation: incorporate new concepts into existing mental structure

Assimilation: fit practice to theory

Complex but familiar external objects are simplified to fit pre-existent categories in your head

ASG 6061124

Accommodation: New object doesn't fit existing mental structure; adaptation

Accommodation: fit theory to practice

You have to change the ideas in your head to fit the realities of external objects

ASG 6061124

COGNITIVE CONFLICT OR DISEQUILIBRIUM

Adaptation via Assimilation, Accommodation and Equilibration

New situation encountered

- Assimilation: The situation “appears” similar to an existing scheme - activity is performed - expected result obtained
- Equilibrium: Existing scheme explains perceived situation
- Accommodation: The activity doesn't lead to the expected result -> disequilibrium, *directs attention back to the situation*
 - Modify perceptual requirements or activity
 - Form new scheme
- Return to state of equilibrium
 - Dynamic state

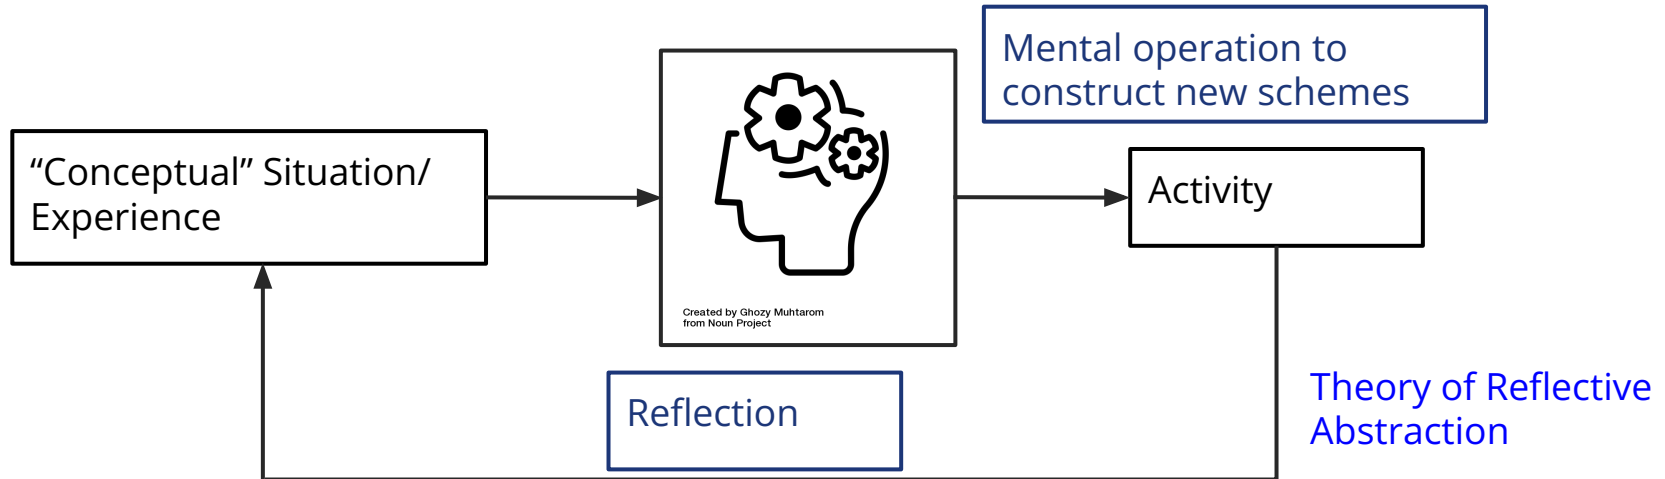

Importance of cognitive conflict

Disequilibrium caused when expected result not obtained

“Unpleasant” feeling -> Motivation for learning

Cognitive Conflict -> “relational surprises” -> awareness of holding two contradictory views about the situation -> rethink view of the world

Modify existing schemes -> learning

Conditions for learning

- Tendency to have repetitive experiences
- Remembering and retrieving (re-presenting) experiences
- Make comparisons and judgements of similarity and differences between experiences
- Elementary values - preferences, likes
- Knowledge: Conceptual structures created by epistemic agents that they consider “viable” given their current range of experience with thinking and language
- Learning and knowledge are instrumental - Utilitarian (action schemes) / epistemic (operative schemes)

Language and communication

- Engendering understanding
- Building blocks of individual conceptual structures - abstracting from individual experience
 - Focusing visual attention
 - Isolating visual signals and forming a visual item or thing
 - Isolate auditory signals
 - Associate with isolated visual item
- Meaning is subjective
- Understanding is a matter of fit
 - Compatibility between conceptual structure and the structure of the words or text
- Language can be used for constraining and orienting conceptual structures
